

Boomback Automation

FluidPulse™

Reduced Automation Costs by 25-50%

The ValveCommander™ replaces *two* 3-way solenoids with just *one* 4-way solenoid. Additionally, this enables the use of much simpler valves (versus traditional automation) which further enables savings.

Eliminates Solenoid Failure

The ValveCommander is the world's first "latching" AC solenoid. It draws power only as it changes position (3 seconds). This is in contrast to regular solenoids that draw power the entire time they are "On" (hours) which is why traditional solenoids burn out so often.

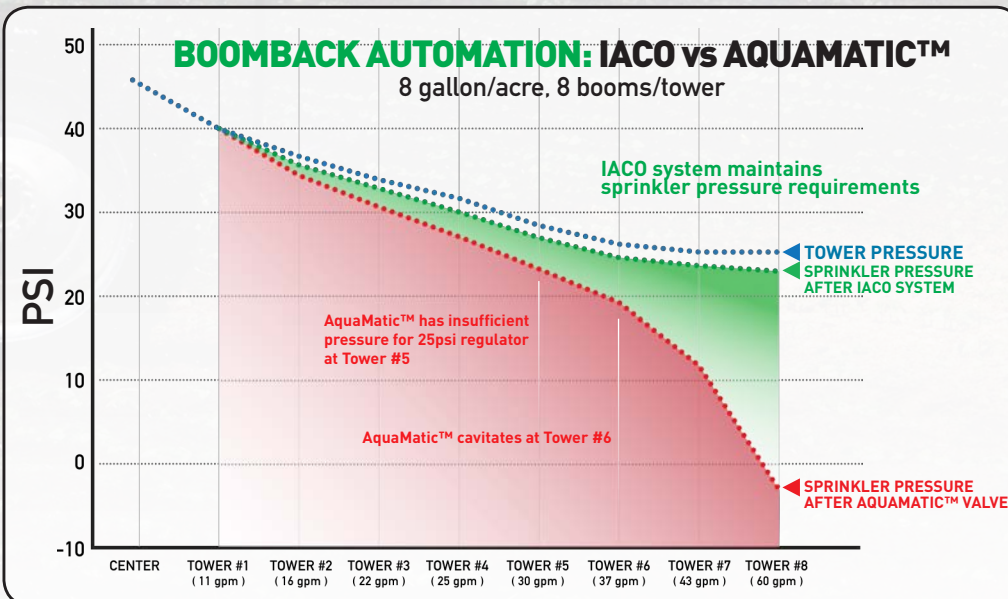

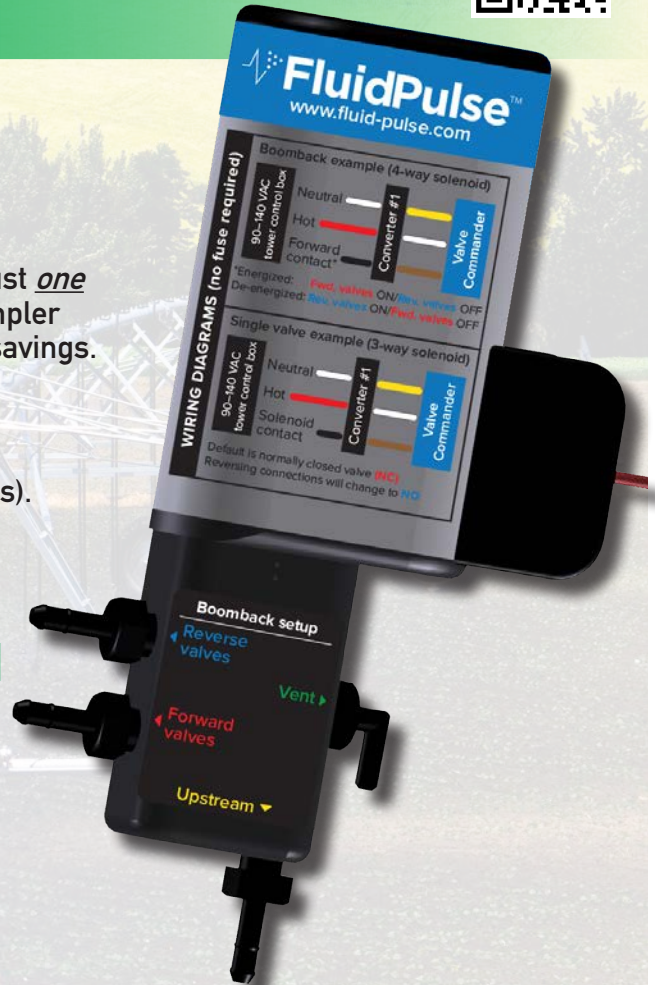

Self-cleaning & Non-corrosive Solenoid

The ValveCommander continually flushes out debris from water. Additionally, because all water contact surfaces are Delrin®, unusual and extreme water chemistry cannot corrode or otherwise harm moving parts.

Freeze Tolerant

All water contact parts withstand repeated freezing.

* The ValveCommander works with all 24-240 VAC control systems. It attaches to the same wires and pipe threads as today's 120-240 VAC solenoids. It also works on many wireless DC controllers.
